Sample Questions of Reasoning

Analytical reasoning

A farmer plants only five different kinds of vegetables - beans, corn, kale, peas, and squash. Every year the farmer plants exactly three kinds of vegetables according to the following restrictions:

If the farmer plants corn, he also plants beans. If the farmer plants Kale one year, he does not plant it the next year. In any year, the farmer plants no more than one of the vegetables that he planted the previous year.

Which of the following is a possible sequence of combinations for the farmer to plant in two successive years?

- A. beans, corn, kale; corn, peas, squash
- B. beans, corn, peas; beans, corn, squash
- C. beans, peas, squash; beans, corn, kale
- D. corn, peas, squash; beans, kale, peas

Correct answer: (C)

Logical reasoning

The greatest chance for the existence of extraterrestrial life is on a planet beyond our solar system. This is because the Milky Way galaxy alone contains 100 billion other suns, many of which could be accompanied by planets similar enough to earth to make them suitable abodes of life.

Above argument assumes which of the following?

- A. Living creatures on another planet would probably have the same appearance as those on Earth.
- B. It is likely that life on another planet would require conditions similar to those on Earth.
- C. If the appropriate physical conditions exist, life is an inevitable consequence.
- D. More than one of the suns in the galaxy is accompanied by an Earth-like planet.
